due to the advances of various methods for the prediction of toxicity of organic compounds and ionic liquids it is necessary to review these methods for scientists and students it is essential to compare the advantages and shortcomings of these methods since many organic compounds and ionic liquids are synthesized each year this book introduces suitable models for the assessment of their toxicities this book reviews the best predictive methods for the prediction of toxicity of organic compounds and ionic liquids which were derived by in vitro or in vivo experiments different available quantitative structure toxicity relationship qstr models based on various descriptors have been discussed to predict toxicity parameters such as LD_{50} 50 lethal dose EC_{50} the concentration of the desired ionic liquid that produces mortality

of 50 percent of the bacterial population and log IC_{50} 1 logarithm of 50 growth inhibitory concentration of *T. pyriformis* of various classes of organic compounds and its the reliability of these methods is compared and discussed each chapter contains some complimentary problems with their answers which can improve the experience of students and researchers the introduced subjects are suitable for advanced students in chemistry biochemistry medicinal chemistry and chemical engineering

217plus is a methodology and a software tool that was developed by the riac to aid in the assessment of system reliability it represents the next generation of the prism software tool initially released in 1999 the original software contained six embedded models to estimate the failure rate of various components when exposed to a specific set of stresses that are defined by the user the 217plus contains twelve embedded component models until the release of this handbook the equations comprising the component reliability prediction models were not available in printed form as such a user of the old software tool could not see the exact equations that comprised the models it is always advantageous for analysts to be able to review details of the models so that reliability prediction results can be better interpreted and supported through mutual practitioner management and customer understanding the riac therefore developed and published this handbook to make available the equations and model parameters that form the basis of the 217plus methodology

the intent of this book is to provide guidance on modeling techniques that can be used to quantify the reliability of a product or system in this context reliability modeling is the process of constructing a mathematical model that is used to estimate the reliability characteristics of a product there are many ways in which this can be accomplished depending on the product or system and the type of information that is available or practical to obtain this book reviews possible approaches summarizes their advantages and disadvantages and provides guidance on selecting a methodology based on the specific goals and constraints of the analyst while this book will not discuss the use of specific published methodologies in cases where examples are provided tools and methodologies with which the author has personal experience in their development are used such as life modeling nprd mil hdbk 217 and the riac 217plus introduction
